1. Introduction

1.1 Purpose

1.2 Scope

Data4Help means to provide services to authenticated users only. Those services are addressed to both:

- Individual Users
- Third parties Users

To dispatch specific functionalities to the user they are reserved, Data4Help System avails itself of:

- a Mobile App, reserved to individual users
- a Web Page, reserved to third party users.

The mobile app, using the GPS location provided by the smartphone, allows the individual user to:

- check his own health parameters (measured by a smartwatch)
- enable and disable additional services (AutomatedSOS and Track4Run)
- give or deny authorization to every third party to access health data about himself.

Data4Helps System handles both data of the past and real time ones. The web page allows the Third-party user to:

- make requests for statistical data of the past or real time
- make a request for individual data of the past or real time (the request is forwarded to the individual user)
- organize and watch run competitions.

This factorization allows the system to be accurate in providing every user with all and only resources he has the right to access: authentication and authorization processes rely on the access control.

The necessity to use a mobile app could prevent third parties from choosing Data4Help over other services of data collection: Data4Help Web Page can be easily accessed from a browser hosted on a computer or a mobile.

1.3 Definitions

- *User*: a person, third-party or user, that has registered;
- *Individual User*: every registered person from whom the system collects data;
- *Third-Party User*: every entity registered with the purpose to request data for external use;
- *Live Data*: the data on a IU produced in real time.
- *Stored Data*: the data on a IU collected so far.
- *Data Request*: a request for data made from a TPU.
- *Stored Data Request*: a data request for stored data.
- *Subscription Request*: a request for subscribing to newly generated data.

1.4 Acronyms

- API: Application Programming Interface
- TPU: Third-party User
- D4H: Data4Help
- ASOS: AutomatedSOS
- T4R: Track4Run
- UX: User experience

1.5 Abbreviations

- Ab: abbreviation

2. Architectural Design

2.1 Overview

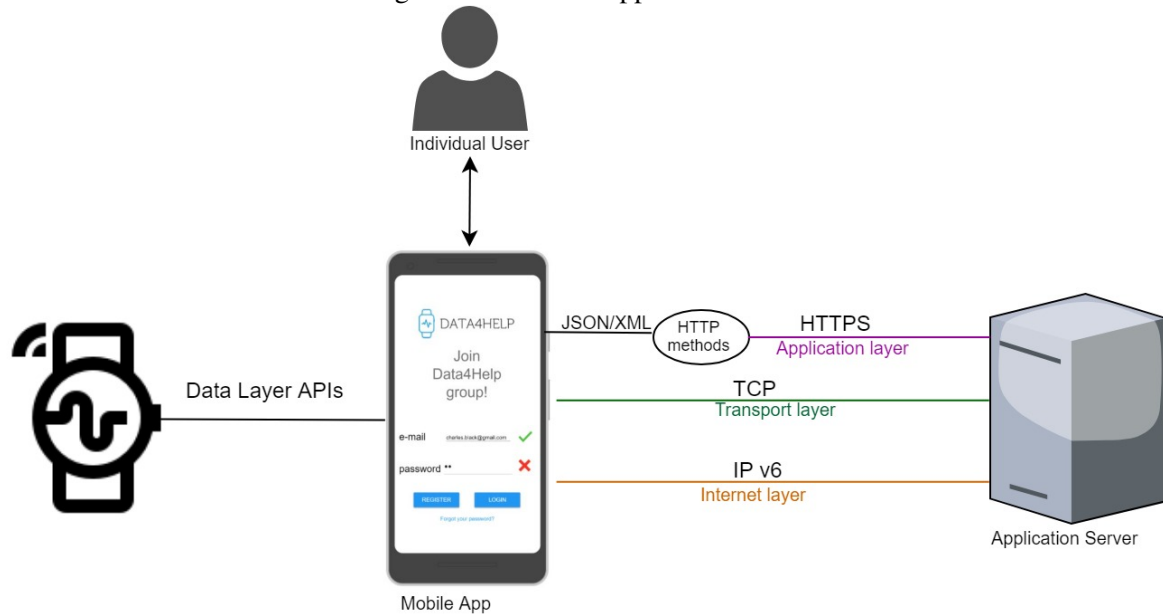

2.1.1 High level components and basic interactions

The overall structure, at high level, is made of three main components and their interaction. The red component refers to the tools the individual user needs to interface with Data4Help System, it communicates with the Application Server that is part of the blue component charged with the Server Architecture. This is composed by a Database Server that includes the DBMS, a Mail Server which means to exchange SMTP messages with other Mail Servers (external to the system), an Application Server communicating with any other element in the Server Architecture, a Web Server and a Proxy (meant to dispatch requests to Application and Web Servers). The proxy links the Server Architecture with the green component charged with the interaction with the third party user that takes place through Data4Help Web Page.

2.1.2 Interaction between Server Architecture and Individual User

Figure 2.2: Mobile App connections

The Mobile App receives data from the smartwatch, exchanges informations with the Individual User and communicates with the Application Server: at different levels are specified protocols that are supposed to be used.

2.1.3 Interaction between Server Architecture and Third-Party User

Figure 2.3: Connection between Web page and Servers

The browser hosting the Web Page needs to communicate both with the Web Server and the Application Server. The Web Server can easily handle and exchange HTML, CSS and JavaScript files with the client; the Application Server manages methods like GET, POST (that are present in the HTML file) receiving a

REST API call and forwarding data in JSON format. Data to forward are provided by the Database Server which includes the DBMS: a request in XML is sent by the Application Server, the DBMS processes the request and extracts data from the database that are sent back to the Application Server in a XML file. To establish a communication channel between the Application Server and the Web Server is not a necessity, however it provides an alternative to REST API: developers are up to decide to implement them both or to keep the REST API alone.

2.2 Component view

The system is divided in four subsystem:

- **Backbone:** The core of the system whose services are used from all other subsystems
- **Data4Help**
- **AutomatedSOS**
- **Track4Run**

The last three are divided on the Application server in a router, to handle requests, and a module, connected to the DBMS, containing all other components of the subsystem.

2.2.1 Backbone

This is the backbone of the system: collects the data on the device, keep it synchronized though the system and provide functionality to receive Live Data and to access to Stored Data; furthermore provide functionality concernig authentication.

Data collector/dispatcher Allow subscription and publishes/dispatches the collected Live Data of the Individual User logged in from the device.

Authentication Offers services related to User authentication.

Data Dispatcher Allow subscription and publishes/dispatches the collected Live Data of all Users. Offers the functionality to access Stored Data of all Users.

2.2.2 Data4Help

Figure 2.5: Data4Help Component View

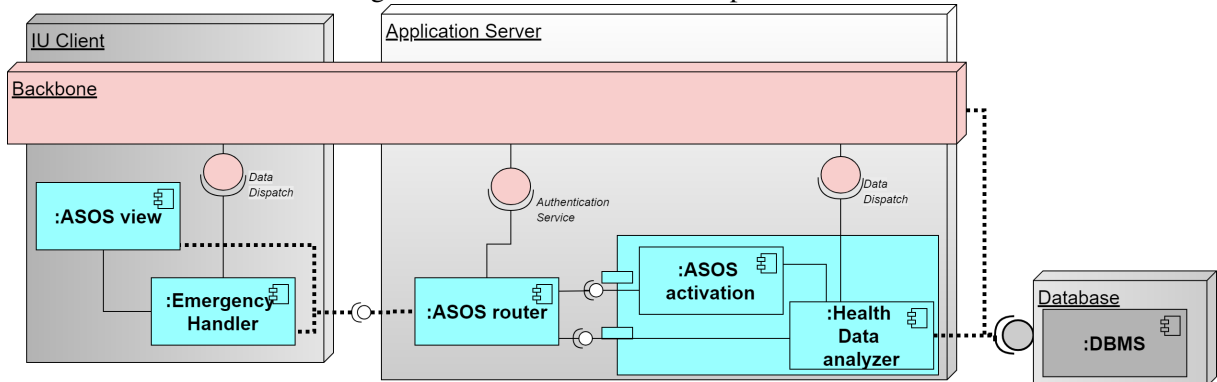

D4H router Validate the requests received from the client and dispatch them to the corresponding module or component.

Data Request Manager Provides functionality to create, approve, deny requests, block users and provide the relative data; Anonymity Evaluator is responsible to check anonymity constraints.

2.2.3 AutomatedSOS

Figure 2.6: AutomatedSOS Component View

ASOS router Validate the requests received from the client and dispatch them to the corresponding module or component.

ASOS Activation Offers the functionality for the activation and deactivation of the ASOS service.

Health Data analyzer Offers functionality to extrapolate the critical health parameters for every Individual User;

Emergency Handler Responsible to handle critical health conditions based on the data published by the Data collector/dispatcher

2.2.4 Track4Run

Figure 2.7: Track4Run Component View

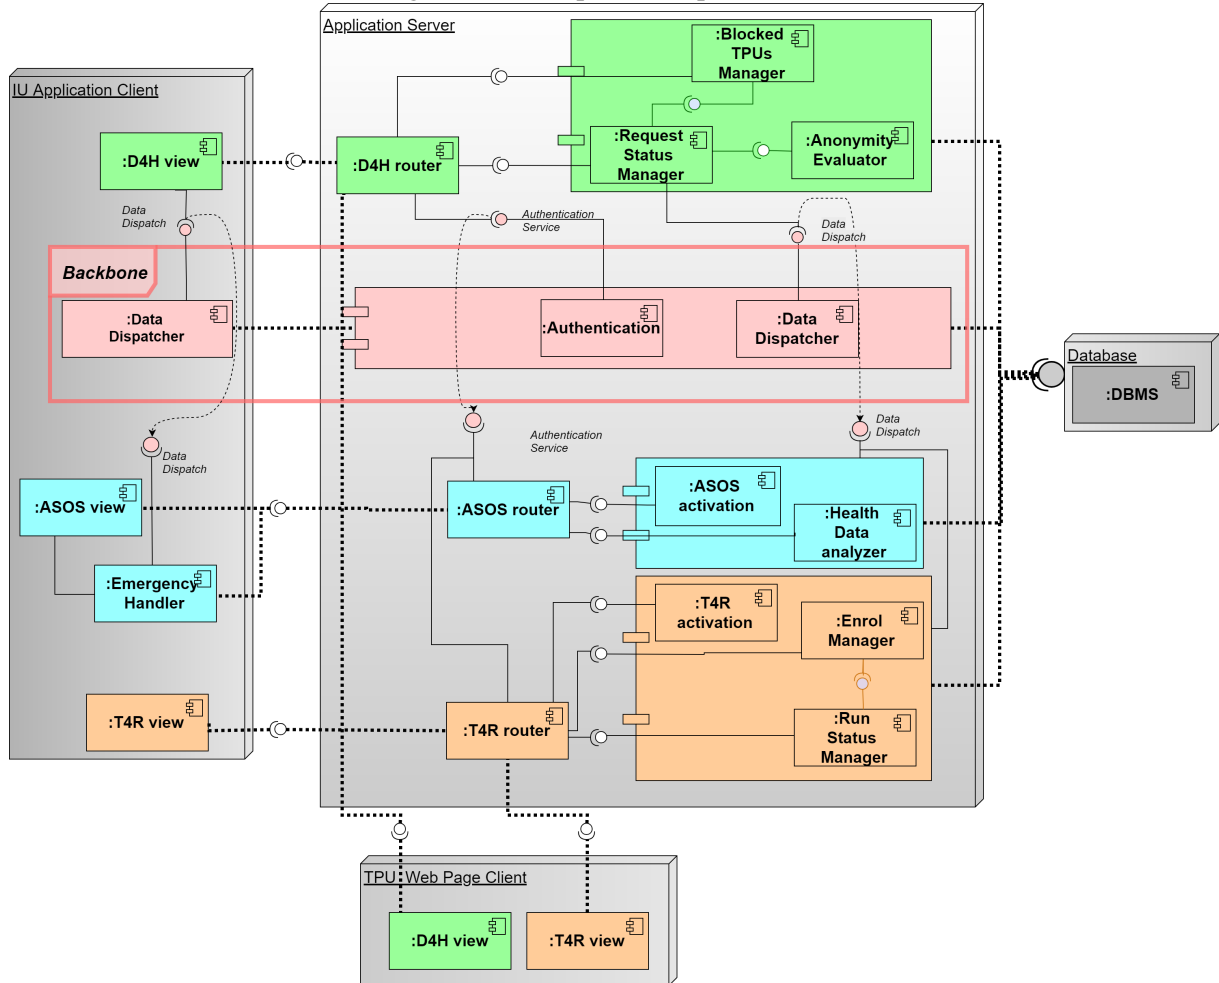

T4R router Validate the requests received from the client and dispatch them to the corresponding module or component.

T4R Activation Offers the functionality for the activation and deactivation of the T4R service.

Run Manager Provides functionality to create, cancel, enrol in and spectate runs;.

2.2.5 Full system

Figure 2.8: Complete Component View

Data Managing From a more high level point of view, the backbone provides services to retrieve the Individual Users data, stored or live.

This makes the red components and modules of the architecture the backbone, collecting and dispatching data, while the other subsystems can handle their unique authorization condition: D4H authorizing data dispatching based on approved requests, ASOS on the activation of the service and T4R on the enrolment in competitions.

This way all subsystem will work independently from each other.

2.2.6 Entity Relationship Diagram

The following section provides a conceptual representation of the model.

Figure 2.9: Entity Relationship Diagram

Tables

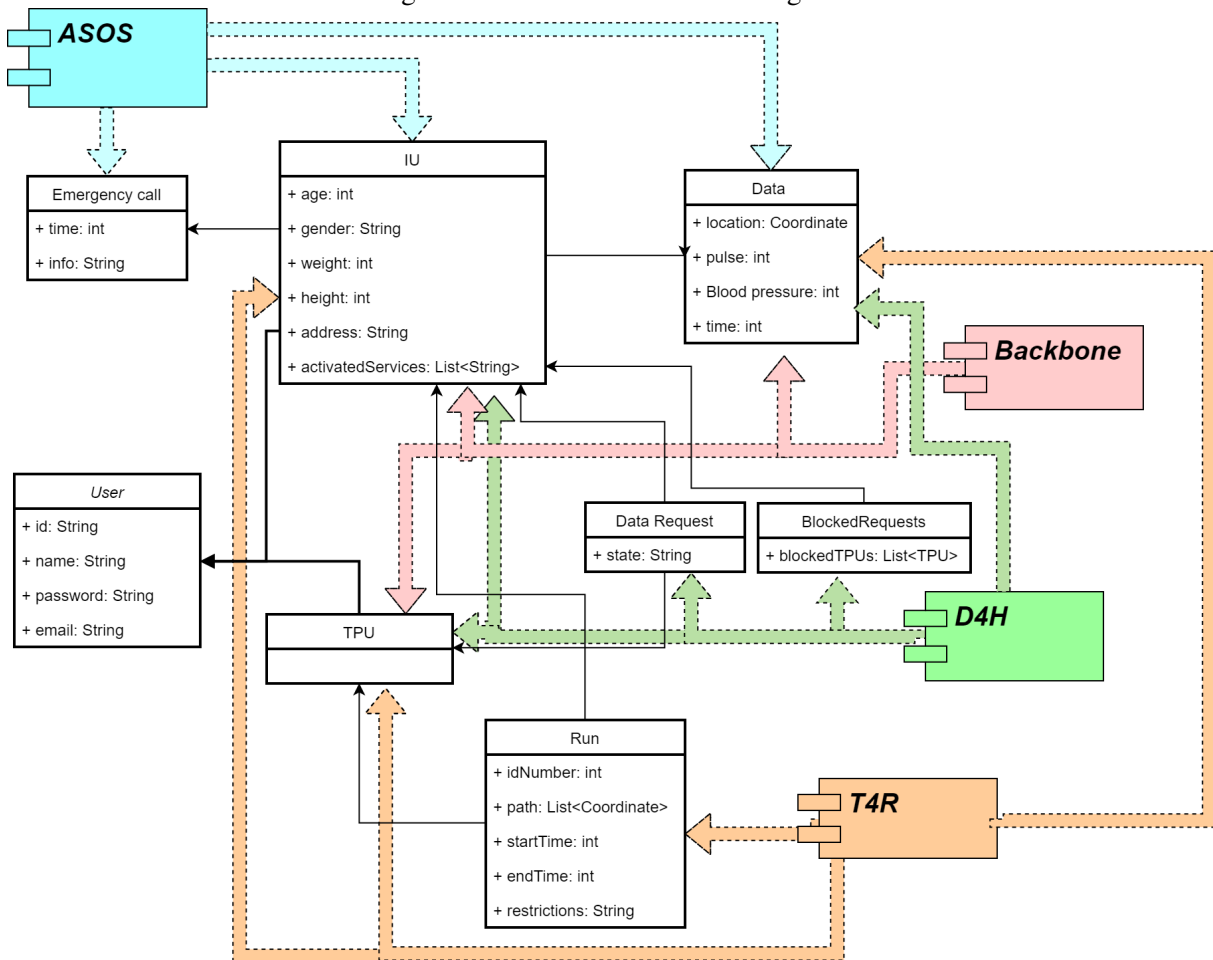

- **User**(ID, Name, Email, Password)
- **TPU**(ID, Name, Email, Password)
- **IU**(ID, Name, Email, Password, Age, Gender, Address, Weight, Height)
- **Data**(IU, Time, Location, Pulse, Blood pressure)
- **Subscription Request**(IU, IU, TPU)
- **Stored Data call**(IU, IU, TPU)

- **Emergency call**(IU, Time, Execution Info)
- **Run**(Identification number, TPU, IU, Path, Start Time, End Time, Restrictions)

2.2.7 Model Interaction Diagram

The following diagram show a different representation of the model to better highlight its interaction with the application server. For each subsystem module that was connected to the DBMS in 2.2.5 is shown its relationship with the module.

Figure 2.10: Model Interaction Diagram

2.5 Component interfaces

2.6 Selected architectural styles and patterns

2.7 Other design decisions

3. User Interface Design

The user interfaces mock-ups are represented in sections 3.1.1, 3.1.2 of RASD. The following UX schemes represents a complete description of the user experience. The screen -T4R unsubscribe screen- has been added and a better description of each mock-up has been provided.

Figure 3.1: Third-party user - UX graphical representation

Third-party user The scheme above represents the main desktop screens and the way -condition and action needed- how the third-party user can move through them.

Figure 3.2: Individual user - UX graphical representation (left part)

Figure 3.3: Individual user - UX graphical representation (right part)

Individual user The two schemes above represents the main mobile screens and the way -condition and action needed- how an individual user can move trough them. The scheme has been divided in two parts in order to provide a better readability.
